- Hygienic mounting, confirmed by EHEDG and 3-A reports
- $p_{max}$ : 10 bar;  $t_{max}$ : 250°C
- Material: stainless steel 1.4404
- Defined positions of Pg screwings
- Easily welded with collar sleeve
- Variable mounting with spherical sleeves
- also suited for small pipe cross-section (M12 x 1.5)

### Description

Special demands are made on installation systems for sensors by CIP (Cleaning In Place) and SIP (Sterilization In Place) cleaning processes.

It is important that gaps and cavities between sleeve and sensor are avoided as product residues that are difficult to remove can collect in these places. What's more, all components of the installation system must be heat resistant to at least 145°C and chemically resistant to the cleaning agents used.

The following sealing methods satisfy these requirements:

1. Metallic sealing system
  - with stainless steel sealing cone (for temperature sensors, for example)
  - with PEEK sealing cone (as insulation for level probes)
2. Clamp screw with sealing washer made of PEEK

### Metallic gasket

When the sensor is screwed in and tightened (torque 30-50 Nm) the sealing edge of the weld-in sleeve is slightly deformed, and presses with its own material tension against the cone of the sensor. The Pg screw on the mounted sensor is aligned with the marking on the periphery of the sleeve.

Three different thread versions are available:

- M12x1.5 - very compact, also for small pipe cross-sections
- G 1/2 - large variety of sensors
- G 1 - for large sensors (for example, multi-stem probes)

### Clamp screwing with PEEK gasket

The sensor is sealed with a conical shaped sealing ring made of high-temperature-resistant PEEK material. By tightening the retaining screw the gap between sensor and sleeve is completely filled in and the sealing washer is pressed against the sensor.
